

BUILDVISION

Add Login Credentials

Some project documents live behind a login, like private SharePoint sites, Google Drive folders, or OneDrive links. BuildVision cannot reach those unless you save credentials. This guide shows you how.

How to Add a Credential

1. Click your **avatar** in the bottom-left corner of BuildVision, then select **User Settings**.
2. Click **Email Settings** and scroll **+ Add Credential**.
3. Choose a **provider** from the grid (Microsoft, Live, OneDrive, Outlook, SharePoint, Google, and more), or use the **Custom** tab for any other service.
4. Give it a **name** (for example work-sharepoint or client-drive). This is just a label so you can identify it later.
5. Enter your **username or email and password** for that service.

6. **Click Create.** BuildVision stores the credential securely and uses it automatically whenever a matching link appears in your emails.

Supported Providers

The **Provider** tab includes pre-configured integrations for the platforms most commonly used to share construction documents.

Microsoft	Live	OneDrive
Outlook	SharePoint	Google
Google Sheets	Google Drive	Custom

Tips & Notes

- **Add one per platform:** You only need one credential per platform, not one per project. A single SharePoint credential covers all SharePoint links your account has access to.
- **Credentials are per user:** Saved credentials belong to your BuildVision user account, not your organization. Each team member who receives protected links in their own inbox should add their own credentials under their own User Settings.
- **Keep passwords yours:** Use credentials that belong to you, and only for platforms where you already have legitimate access. BuildVision stores credentials securely and only uses them to retrieve project documents on your behalf.
